# RAKSHAK — Demo Video Script

Max 3:00 | AgentX Hackathon 2026 | Team Smooth Operator | PS-03

## 0:00 – 0:15 — Hook — the problem

*Voiceover / face cam over a slide: disaster scene or news headline.*

> *"During floods or disasters, reports flood in from everywhere — calls, messages, WhatsApp — but response teams are overwhelmed and slow to triage. Rakshak is a multi-agent system that senses, decides, and responds — automatically, in real time."*

## 0:15 – 0:30 — The architecture, fast

*Cut to dashboard homepage, point at the hero number.*

> *"Three AI agents work together: Sentinel triages incoming reports, Dispatch matches the nearest available volunteer and decides if it's safe to auto-confirm, and Bulletin sends residents a real status update in their own language."*

## 0:30 – 1:00 — Live trigger — THE wow moment

*Open Telegram on your phone, screen-record it. Type a real incident message to @RakshakBulletinBot, hit send. Cut to dashboard, refresh — new incident appears within seconds.*

> *"Watch this — I'm messaging our live bot right now, like any resident would."*
>
> *"No mock data, no scripted demo — that just became a real row in our database, live."*

## 1:00 – 1:35 — Agents working — show the toast feed

*Dashboard activity log panel, let it scroll. Click Approve on the held card.*

> *"Sentinel just triaged it — severity, ward, resource type decided automatically. Dispatch found the nearest available volunteer. Because this one's severity 4, it's held for human approval instead of auto-confirming — that's a deliberate safety guardrail, not a gap."*
>
> *"I approve it —"*

## 1:35 – 2:05 — The payoff — real message, real phone

*Cut back to your phone, Telegram notification arrives. Show the message on screen, read a line of it aloud.*

> *"—and Bulletin just drafted and sent a real status update, in Hinglish, back to the resident's phone. Automatically. No human wrote this message."*

## 2:05 – 2:30 — Map + resilience

*Pan to the live map, hover a couple of incident dots.*

> *"Every incident is geotagged and tracked live on the map. And it's built to never go blank — if map tiles are ever blocked, it falls back to a self-contained offline view automatically, so responders are*

*never looking at a broken screen during an actual disaster."*

## 2:30 – 2:50 — Why it matters / close

*Back to face cam or wide dashboard shot.*

> *"Rakshak turns scattered reports into coordinated action in seconds — with a human still in the loop for the decisions that matter. Try it yourself right now, message our bot — it's live."*

## 2:50 – 3:00 — End card

*Slide: team name, repo link, "Try it: @RakshakBulletinBot".*

### Shooting Tips

• Pre-send one test message 2–3 min before recording so the dashboard already has a couple of older incidents in the feed — don't demo on an empty board.

• Do the Telegram trigger and the dashboard refresh as two camera angles (phone + laptop), or screen-record both and edit together — this is the single most important 15 seconds, don't rush it.

• Record extra approval-click footage as backup in case the real Telegram round-trip takes a few seconds longer than expected on the take.
